INTRODUCTION

A project is a structured effort that involves a set of tasks and activities designed to achieve a specific outcome. Projects are widely used in industries such as construction, technology, and education to drive innovation, solve problems, or introduce new systems. They can range from simple, individual tasks to large, complex initiatives that require careful planning, coordination, and resource management. Every project typically follows a life cycle, including stages like initiation, planning, execution, and closure. Successful projects not only meet their objectives but also deliver value to stakeholders within the constraints of time, cost, and quality. In modern project management, methodologies like Agile and Waterfall are often employed to enhance the efficiency and adaptability of project processes.
